KIVO · BUILD NOTES

Stack, requested changes and bug fixes

Covers Nov 5 to Nov 6, 2026 · Branch `claude/awesome-hopper-deiu3s` on `cassandrako/kivo`

Prototype: claude.ai/artifact/2LyPSBfUhf9wK5Y7ESyE6B · Walkthrough: claude.ai/artifact/9Ur5tJnk5Qg37W2Jjqe5UU

Kivo is an Anki-style study app for healthcare students. Over the last day it went from a Figma design to a working web prototype, with sign-up for four student types, Anki's FSRS scheduling, exam folders, a course catalog and account-wide review limits. Every change below was tested in a headless browser with no errors.

1. The stack

Kivo is currently a front-end-only web prototype with no build step. Nothing runs on a server.

LAYER	WHAT IT IS NOW
Language	Plain JavaScript (ES2020+), HTML and CSS. No TypeScript, framework or npm packages.
App and screens	`prototype/js/app.js` : a single-page app. Screens are built as HTML strings, navigation uses `#/home` -style URLs, and one click handler runs every button.
Styling	`css/tokens.css` (colors, type and spacing for light and dark themes) and `css/app.css` . Font: Inter.
Data	`js/store.js` saves everything in the browser (localStorage), with one library per account.
Scheduling	FSRS-5, the algorithm modern Anki uses, with Anki-style learning steps (1m, 10m), daily limits, leeches, burying and undo. Written from scratch in `store.js` .
Sign-in	`js/onboarding.js` . Apple and Google are simulated screens; accounts live only in the browser.
Content	`data.js` and `personas.js` (four sample students) and `catalog.js` (course suggestions by program, year and term).
Hosting	Any static file server (locally `python3 -m http.server`), plus a private claude.ai page.
Testing	Playwright scripts driving headless Chromium, desktop and iPhone sizes. The scripts are not in the repo yet.
Design	Figma file with the design system and screens. It is now behind the app.

Code	GitHub: `cassandrako/kivo`.

To ship (from docs/platform-strategy.md)

- **Web:** React + TypeScript, built with Vite or Next.js.
- **iOS:** React Native with Expo, sharing the scheduling and data code with the web app.
- **Backend:** a hosted database with sign-in (for example Supabase on Postgres), with built-in Sign in with Apple and Google and sync across devices.
- **Calendar:** real Canvas and Google Calendar connections in place of `.ics` uploads.
- **Sign-in cost:** Google is about an hour of setup. Apple is about a day and needs the $99/year Apple Developer Program. On iOS, an app that offers Google sign-in must also offer Sign in with Apple.

2. Changes you asked for

Product direction

YOU ASKED FOR	WHAT CHANGED	WHERE
Everyone keeps their own deck	Sharing is personal-first: each person gets their own copy, and the original author's updates arrive as suggestions to accept or skip.	Share dialog, collection page
Anki at the core, more structured recall; no "write it out"	Spaced review is the main mode. Multi-part answers have a key-points checklist that suggests a rating. Writing out answers was removed.	Study screen
Quizlet-style quiz from your own cards	Practice quiz: multiple choice and true/false built only from your cards. It never changes the schedule.	Collection, exam and course menus
Real schools	Pennsylvania College of Optometry (Salus University), Penn Perelman, Columbia Dental, University of Toronto.	Sample students
Enter exams; import Canvas or Google; no Explore page	Manual exam entry and `.ics` calendar import. Explore was removed.	Exams page
Make new cards, courses and collections; study any level; Anki feature list; no flashcard or clinical-case modes	Add card is always one click away and clicking a card edits it. Study works at course, exam or collection level. Full list in `docs/anki-feature-map.md`.	Sidebar, Library, Study

Semester folders you can archive; archived reviews pause	Semesters hold courses. Archiving folds a semester away and pauses its reviews until you restore it.	Library
Never mix courses in one review	Reviews run one course at a time. There is no mixed “study everything”.	Home, Study
Compact Home, no “Suggested next”	Removed it. Exams and Jump back in sit on the right.	Home
Exam folders, not units	Semester → Course → Exam → Lecture collection. No sections inside a collection.	Library, course page
Your fox logo	Fox mark with the “kivo.” wordmark and the tagline “a little smarter, every day.”	Everywhere

Sign-up and setup

YOU ASKED FOR	WHAT CHANGED	WHERE
Sign up and log in, with name, program, degree and details; Google and Apple	Apple, Google (simulated) or email, then six steps: name, program, details (degree, year, school, graduation year, boards; or major and target for pre-health), courses, exams, daily limits.	Welcome screen
Four sample students	Alex Rivera (OD1, PCO), Maya Chen (MS1, Penn Perelman), Jordan Okafor (D2, Columbia Dental, Apple) and Sam Patel (pre-med).	“Prototype: try it as”
Pre-med should be a 4th-year UofT Life Sci student	Sam is now a 4th-year Physiology (Life Sciences) student at the University of Toronto, with PCL302H1, IMM340H1, PSL301H1, MCAT Prep and an April MCAT.	Sample students
Too many foxes; simpler sign-up	One small logo. The big purple panel and repeated foxes are gone, the screens are a single column, and the icons on choices were removed.	Sign-up screens
No sample cards; a tutorial instead	Accounts start with courses and exam folders only. A Get started guide on Home: make a collection, add a card, review it, find New. Each step ticks off when you do it.	Home

Course suggestions by semester, with room for your own	Course catalog by program, year and term, merged with every sample student's courses. Browse other years and terms or type your own. The New course form suggests courses too.	Sign-up, New → Course
Custom review amounts for the account, like Anki	New cards and maximum reviews per day are set at sign-up and in Study settings in the account menu. Each course can use them or switch to its own.	Account menu, Review settings

Library and cards

YOU ASKED FOR	WHAT CHANGED	WHERE
One "New" button that cascades	New opens Card, Lecture collection, Exam, Course, Semester and Import cards.	Library, course page
Collection page too busy; drop sharing; badges look like GitHub tags	Sharing and the details panel are gone, and the page is one column. Exam, date, lecture, card count and retention sit on one line. Share is in the ⋯ menu, and card status is plain text instead of colored badges.	Collection page
More flexible card creation, like Anki	Add card has a Course picker, then a Collection picker ("Exam › Lecture"), like Anki's deck chooser. "+ New collection…" makes one right there.	Add card
Drag decks into exam folders	Drag a collection onto an exam folder, onto "take it out of the exam", or onto a course in the sidebar. Each move has Undo, and phones get a Move menu on each row.	Course page, sidebar

Demo and portfolio

YOU ASKED FOR	WHAT CHANGED	WHERE
Show a user flow on a MacBook	A 2:22 recording of a new optometry student, with a visible cursor and captions, in a MacBook frame with 16 clickable chapters.	Walkthrough page
Remove the "Kivo prototype · MacBook · 1440 × 900" line	Removed.	Walkthrough page

Download it for a portfolio	Three files: the plain video, a 1920×1080 video with the MacBook frame, and a zip of the walkthrough page to host anywhere.	Sent in chat

3. Bugs fixed

BUG	CAUSE	FIX
A new Ocular Physiology card went into Final › Visual Pathway Basics	New → Card dropped the course you were on. The card editor then used the last collection you had used, from any account, even in an archived semester.	Add card follows the course, exam or collection you are viewing. An empty course asks you to make a collection there and brings you back. Archived semesters are never picked, and “last used” is per account.
Get started’s Review step opened Visual Pathway Basics with nothing to study	It opened the first collection with any cards, including archived ones, where reviews are paused. The guide also counted archived content.	The guide counts only active courses and opens a collection with cards due, named on the button.
Old sample content (“Final”, the Summer Bridge program) in your account	Accounts made before sample cards were removed still held the sample library.	A one-time cleanup removes sample notes, their collections, the archived sample semester and fake activity. Your own cards stay.
Studying an archived collection said “Nothing to study”	The message didn’t explain the pause.	It now says reviews are paused and how to restore the semester.
A wrong password cleared the email field	The log-in form re-rendered without keeping the email.	The email is kept.
Apple sign-in could open Jordan’s sample account	The Apple email field was pre-filled with a sample student’s email.	It is now an empty field with a placeholder.
Moving a collection to another course kept the old course’s exam	The exam wasn’t checked against the new course.	A foreign exam is cleared on move.
Add card after a move used the old course	The page context still held the old course.	The collection whose page you are on wins.
New collection defaulted to the first exam, even a past one	It took the earliest exam folder.	It defaults to the next upcoming exam.

Study screen showed fixed limits (20 new, 200 reviews)	The note was hard-coded.	It shows your real account limits.
Course settings hint didn't change after switching to custom	The hint wasn't re-rendered.	It updates with the choice.
Layout: suggestion dropdowns full width; ⋯ on its own row on phones; MacBook base overlapping chapters	CSS conflicts.	Fixed.

4. Testing

Each change ran in headless Chromium at desktop and iPhone sizes. Latest run: **all passing, no page errors**.

- **Sign-up:** all four sample students, email sign-up and log-in, wrong password, sign-out, staying signed in after reload, Apple Hide My Email.
- **Get started guide:** all four steps, Skip, course suggestions by year and term, custom courses, account and course limits.
- **Logic (16 checks):** archive pauses and restore resumes, one course per session, quiz leaves the schedule alone, rating and undo, limits and overrides, deleting a course, libraries kept per account.
- **Card placement:** every Add card entry point, empty courses, archived content kept out of the picker.
- **Old accounts:** sample content removed once, your cards kept, the guide completes.
- **Drag and drop:** into an exam, out of an exam, onto another course, Undo, same-folder drop, the Move menu.

5. Open items

- **Figma:** behind the app (semesters, exam folders, sign-up, Get started, the new collection page, the logo).
- **Course and Exam pages:** still use colored count badges. They could get the same cleanup as the collection page.
- **Sample students:** they pre-fill their courses and exam dates. Decide whether they should start unticked like a brand-new user.
- **Walkthrough page:** "Try it yourself" points to the private prototype. Share the prototype or remove the button.
- **Tests:** move the Playwright scripts into the repo so they can run on every change.
- **Shipping:** real accounts, sync, sharing and calendar connections need the backend in section 1.
